ECSTASY

Ecstasy is a synthetic psychoactive drug which produces central nervous system stimulation and hallucinations. It is a member of the amphetamine family. It is most often distributed at late night parties ("raves"), nightclubs, and rock concerts.

Adverse side effects include nausea, hallucinations, chills, sweating, increased body temperature, anxiety, depression, high blood pressure, panic attacks, loss of consciousness, seizures, heart failure, strokes and death.

Permanent brain damage may manifest in depression, anxiety, inability to concentrate, and memory loss.

The use of this drug has increased over 500% in the past 5 years, and hospital emergency rooms are reporting numerous serious events.

Logos for the drug are produced to coincide with holidays or special events. Among the popular logos are butterflies, lightning bolts, and four-leaf clovers.

Don't become a statistic: Say NO to ecstasy!

We at the Health Center will be happy to help you.

Healthfully yours,

Dr. Healthberry
